FreeCAD Cheat Sheet: Sketcher Constraints

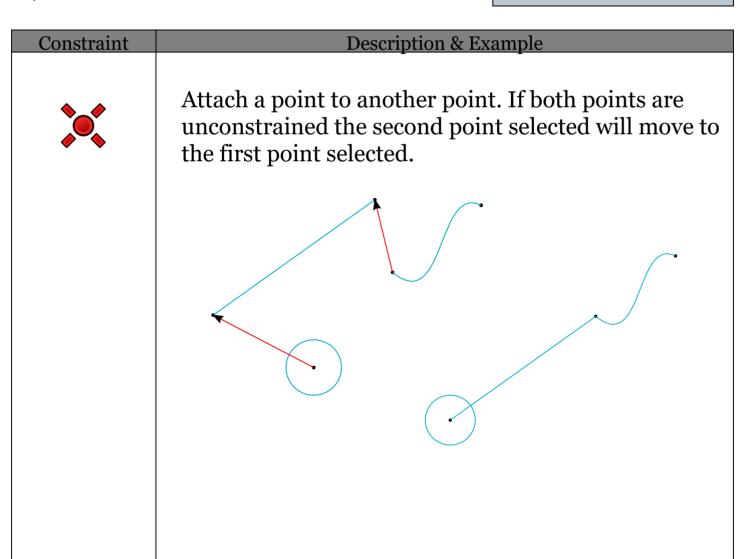

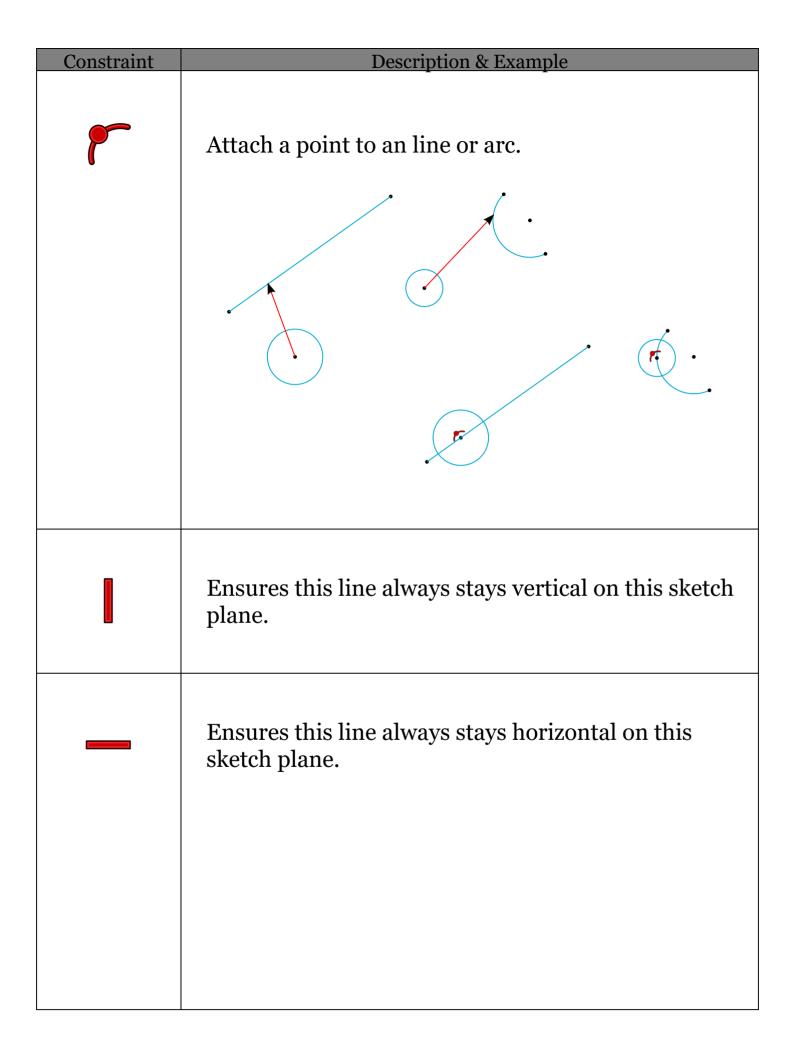

- 1) Coincident
- 2) Point on Object
- 3) Vertical
- 4) Horizontal
- 5) Parallel
- 6) Perpendicular
- 7) Tangent
- 8) Equal
- 9) Symmetric
- 10) Block

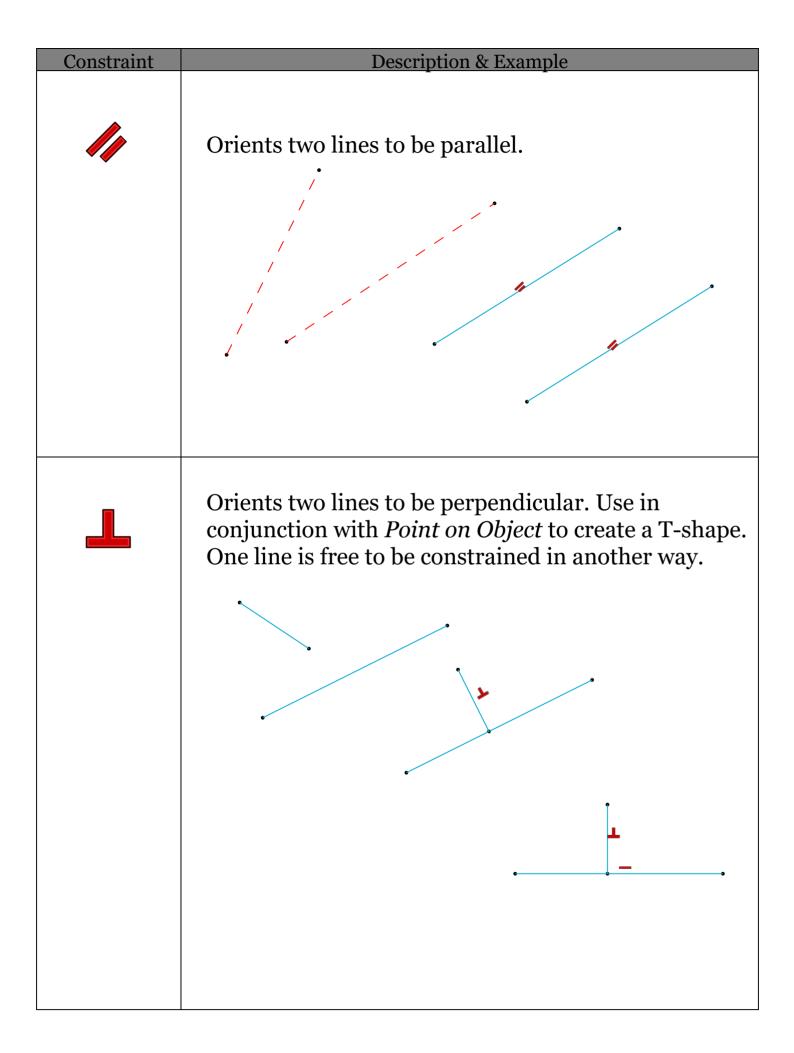

- 11) Lock
- 12) Horizontal Distance
- 13) Vertical Distance
- 14) Length
- 15) Radius
- 16) Diameter
- 17) Angle

What is a constraint?

Constraints ensure points or lines with a geometric relationship stay consistent throughout the sketch.

| Constraint | Description & Example |
|------------|--|
| | Attach an arc or ellipse to a line or another arc/ellipse. Can also be used to make two arcs/ellipses share tangency and two lines collinear. |
| | |
| | |
| | |
| | Ensures two lines share the same length or an arc or circle share the same radius. If both circles or arcs are unconstrained the second shape will match the first selected shape. |
| | |

| Constraint | Description & Example |
|------------|--|
| S | Orients two points to share the same distance from a line. Preselect two points and a line before invoking this command. Use <i>Equal</i> to ensure figures mirrored across the line are uniform. Use <i>Distance</i> to set the distance from the line of symmetry. |
| | Prevents lines from changing slope/angle, length or location. |
| | Applies a <i>Distance</i> consraint to a point relative to the sketch origin. Preselect one point before invoking this command. |

| Constraint | Description & Example |
|------------|--|
| H | Dimensions the length of a horizontal line or distance between two points. |
| I | Dimensions the length of a vertical line or distance between two points. |
| | Dimensions a line or distance between two points. |
| 0 | Dimensions the radius of a circle or arc. |
| Ø | Dimensions the diameter of a circle or arc. |
| | Dimensions the angle between two lines. |
